from Rapid Development

“Software projects contain too many variables to be able to set schedules with 100-percent accuracy. Far from having one particular date when a project would finish, for any given project there is a range of completion dates, of which some are more likely and some are less.”

Project Cost and Schedule Uncertainty

Barry Boehm, 1995

Manifesto for Agile Software Development

We are uncovering better ways of developing software by doing it and helping others do it.
Through this work we have come to value:

Individuals and interactions over processes and tools
Working software over comprehensive documentation
Customer collaboration over contract negotiation
Responding to change over following a plan

That is, while there is value in the items on the right, we value the items on the left more.

Individuals and Interactions over Processes and Tools

Skilled Self-Organizing Teams

- Developers work together to organize the work
- Customer or Product Owner works with the teams to define work and establish priorities
- Managers usually take an outward focus, removing roadblock, rather than managing day-to-day tasks and schedules.

Collaboration

- Daily standup meeting
- Pair programming or Daily reviews
- Shared code ownership
- Team room

Working Software over Comprehensive Documentation

- Each team has different needs
- Less formal documentation might work.
- Prefer executable Documentation

Customer Collaboration over Contract Negotiation

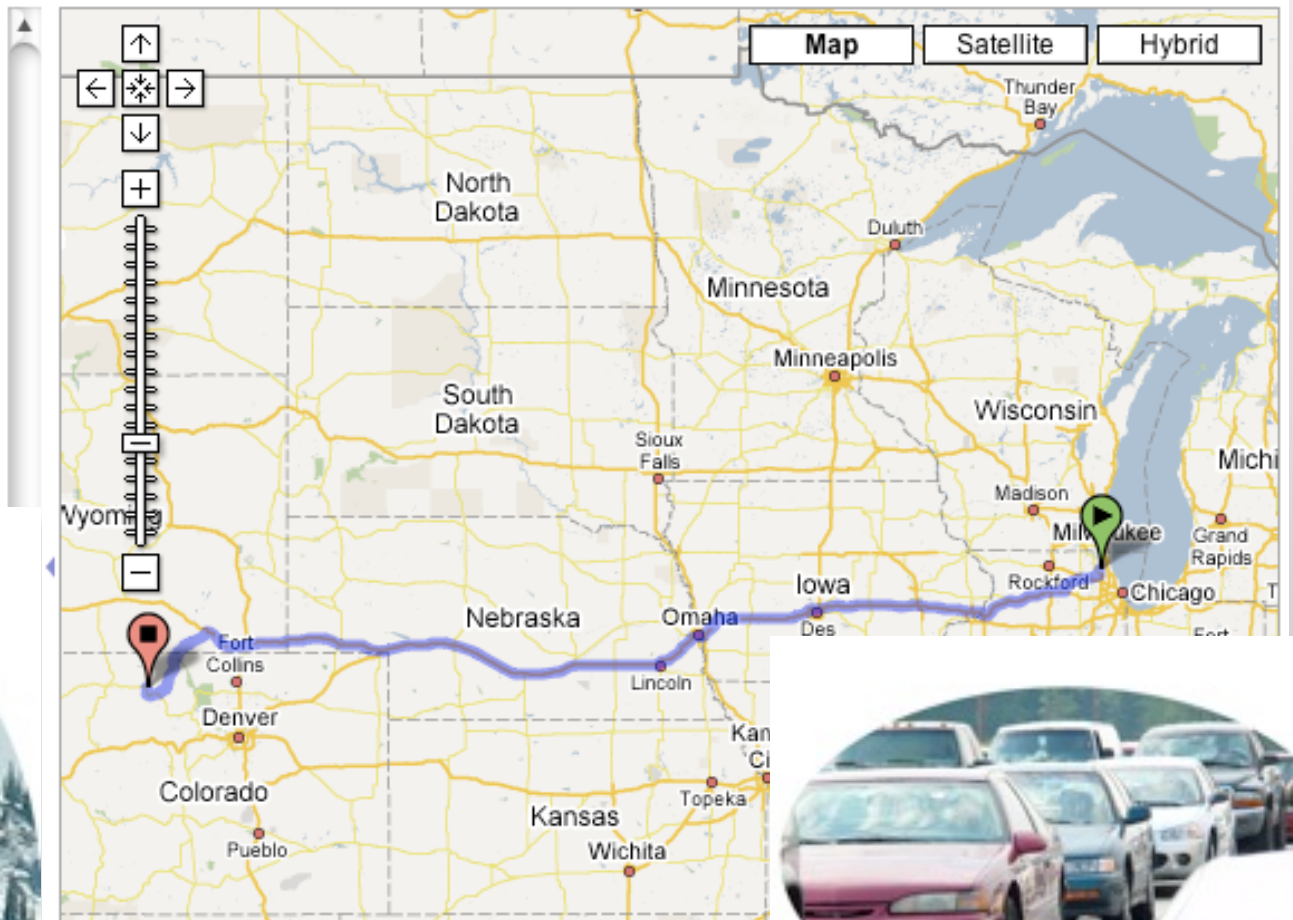

Responding to Change over following a plan

Agile Approach is more...

- Visible
- Predictable
- Productive
- With a focus on
 - High Quality Work
 - Reduced Waste

Challenges for Embedded

- Stories and incremental scope control
- Breaking dependencies on hardware
- Applying outside of software
 - Mechanics, hardware, ASIC development
- Not unique to embedded, though prevalent
 - Your own preconceived notions
 - Organizational resistance

Iterative and Incremental Development

Projects end, products don't (hopefully)

Requirements analysis is never done

Design is never done

Why Iterative?

- A system's users seldom know exactly what they want and cannot articulate all they know
- ... There are many details we can only discover once we are well into implementation
- ... as humans we can only master only so much complexity
- ... external forces lead to changes in requirements...

[LARMEN]

“A complex system designed from scratch never works, and cannot be made to work. You have to start over, beginning with a simple system.”

A Complex system that works is invariably found to have evolved from a simple system that worked

Change Becomes Visible

The Backlog is Made up of Stories

- The short term plan is more detailed.
- Work on it, buying time to refine longer term plan.

- Generally stories are in the order set by *customer*.
- Engineers can ask to move up stories to reduce risk.
- Stories are tested in the iteration they are implemented; story tests are automated.
- A story is done when it passes its tests.

Introducing the User Story

- The name of a feature.
- A promise for a conversation. (Ron Jeffries)
- Like the name of a use case, or extension.
 - Acceptance tests provide the details.
- Fine grains help make visible progress and avoid gold plating.
- I call them Product Stories

Stories and Acceptance Tests

- Stories lack detail
- Details are provided in automated acceptance tests
- The test are like executable use cases
- Test either pass or fail

Fine Grained Scope Control with Product Stories

Technical Practices

High Quality - Visible Progress

- Concurrent requirements and design
- Automated test, continuously, at many levels
- Test Driven Development
- Continuous Refactoring
- Architectural Vision
- Evolutionary Design
- Continuous Integration
- Coding Standard
- Team code ownership
- Pair Programming
- Team workspace

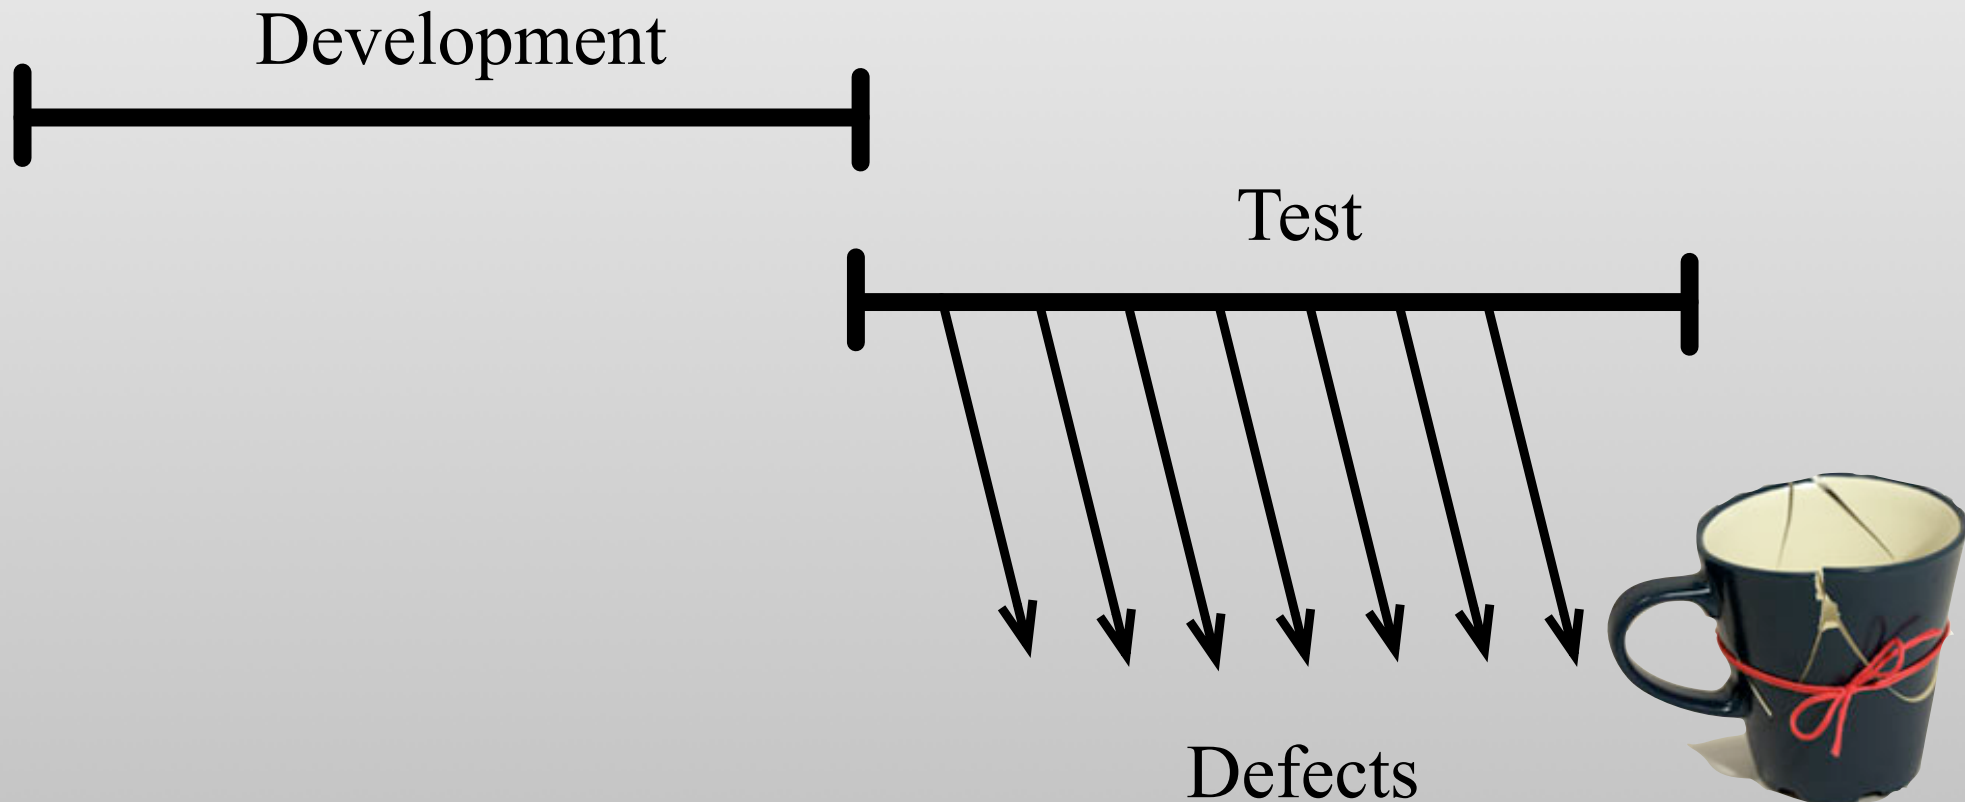

Edsger Dijkstra

Those who want really reliable software will discover that they must find means of avoiding the majority of bugs to start with, and as a result, the programming process will become cheaper. If you want more effective programmers, you will discover that they should not waste their time debugging, they should not introduce the bugs to start with.

Can we Realize Dijkstra's
Dream and
Prevent Defects with
Test Driven Development?

This Work Flow is Designed to Produce Defects

Your program will have bugs. And they will surprise you when you find them.

`BOOL ConvertDays(UINT32 days, SYSTEMTIME* lpTime)`

One That Got Away

```
static void SetYearAndDayOfYear(RtcTime* time)
{
    int days = time->daysSince1980;
    int year = STARTING_YEAR;
    while (days > 365)
    {
        if (IsLeapYear(year))
        {
            if (days > 366)
            {
                days -= 366;
                year += 1;
            }
        }
        else
        {
            days -= 365;
            year += 1;
        }
    }

    time->dayOfYear = days;
    time->year = year;
}
```

Your program will have bugs. And they will surprise you when you find them.

This Test Could Have Prevented it

```
TEST(Rtc, check20081231)
{
    days = daysSince1980(2008, 366);
    CHECK(ConvertDays(days, &time));
    assertDate(WED, 2008, 12, 31);
}
```

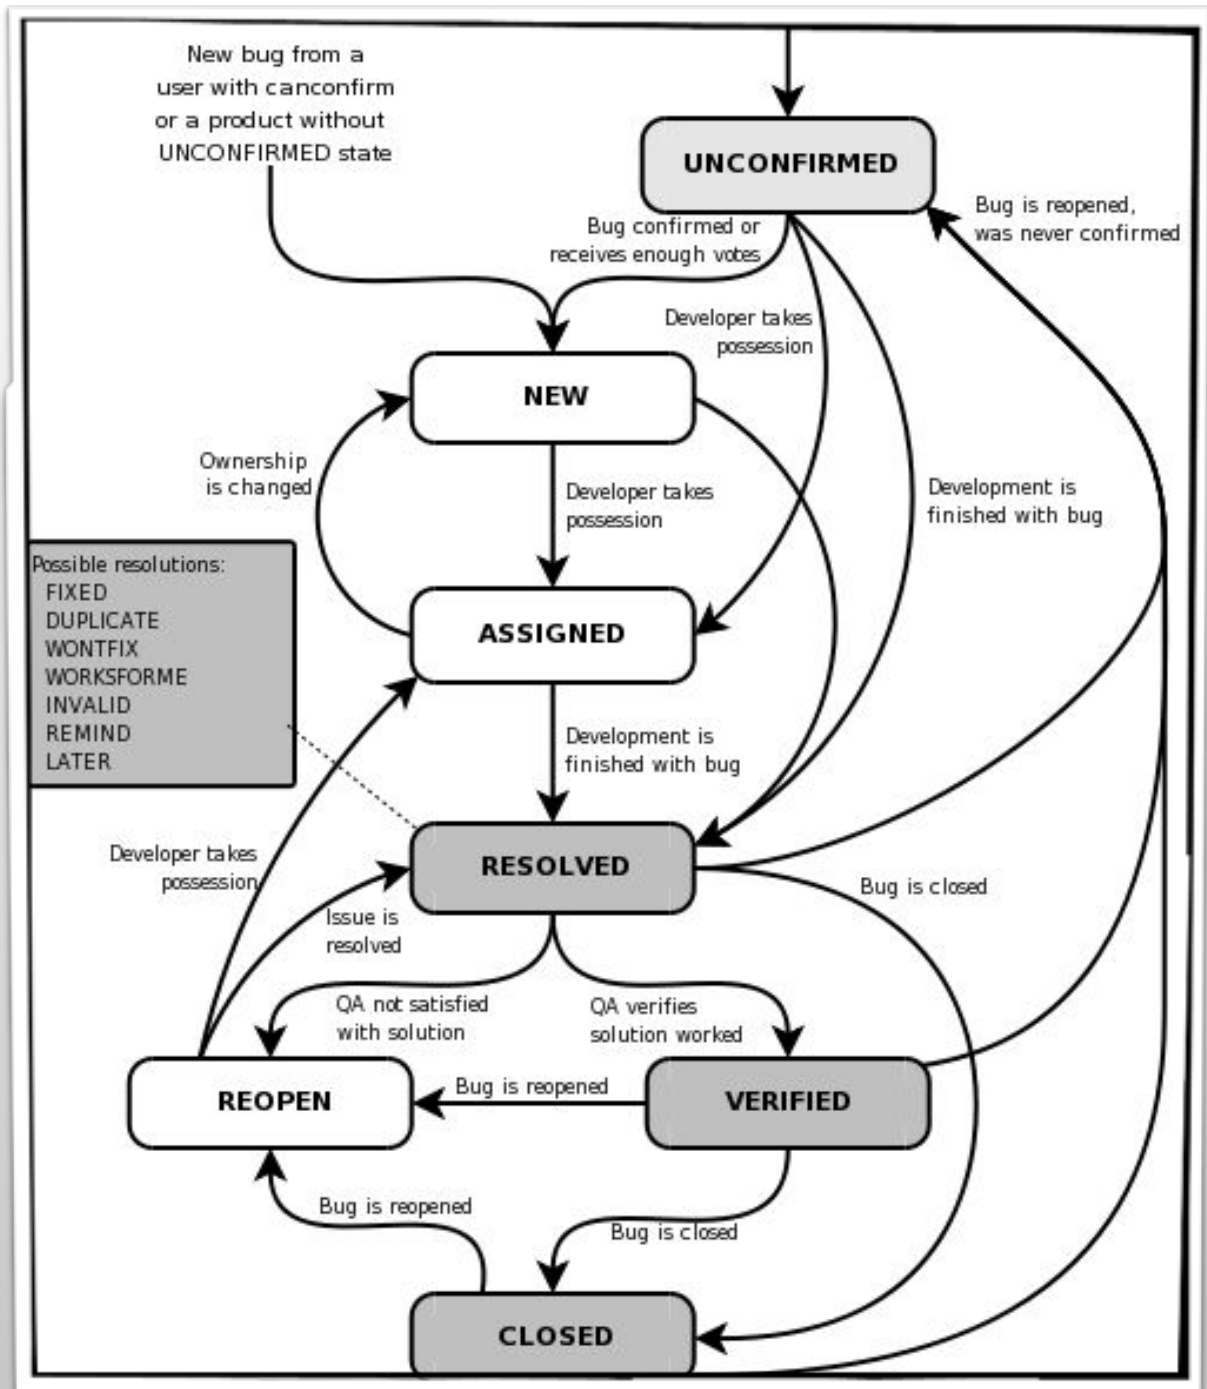

The Physics of Debug Later Programming (DLP)

- As T_d increases, T_{find} increases dramatically
- T_{fix} is usually short, but can increase with T_d

A Bug's Life

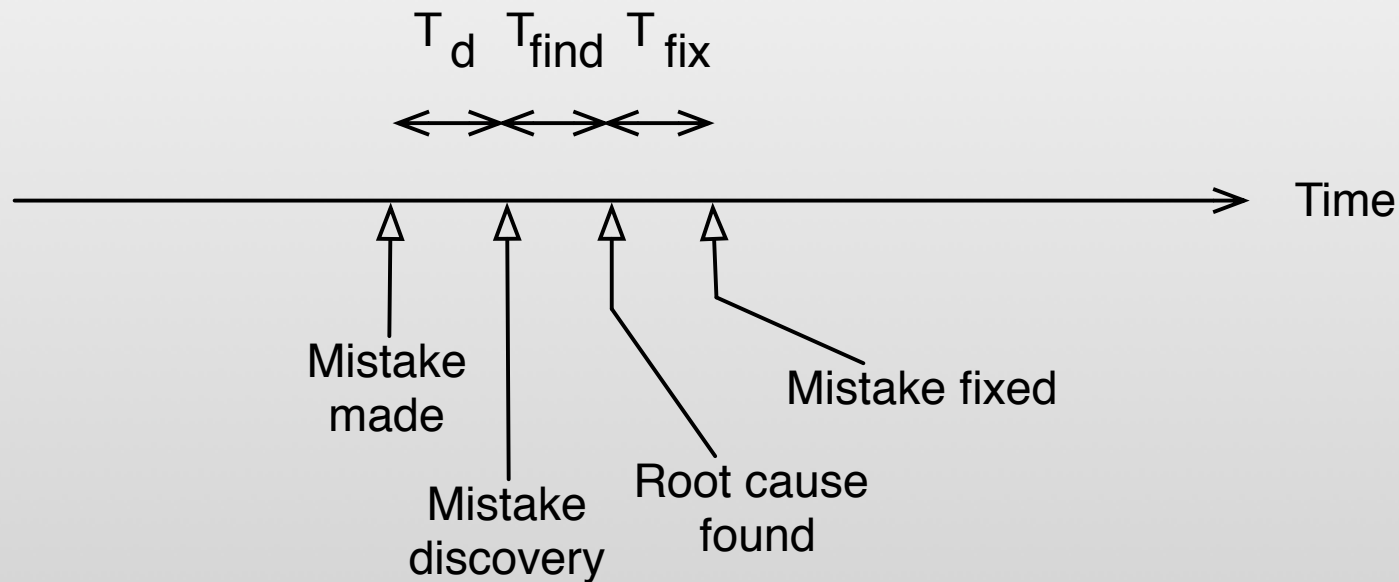

T D D

- Write a test
 - Watch it not build
 - Make it build, but fail
 - Make it pass
 - Refactor (clean up any mess)
- Repeat until done

Development and Test are a Continuum preventing defects

The Physics of Test Driven Development

- When T_d approaches zero, T_{find} approaches zero
- In many cases, bugs are not around long enough to be considered bugs.
- See: <http://www.renaissancesoftware.net/blog/archives/16>

Testing is not a Phase

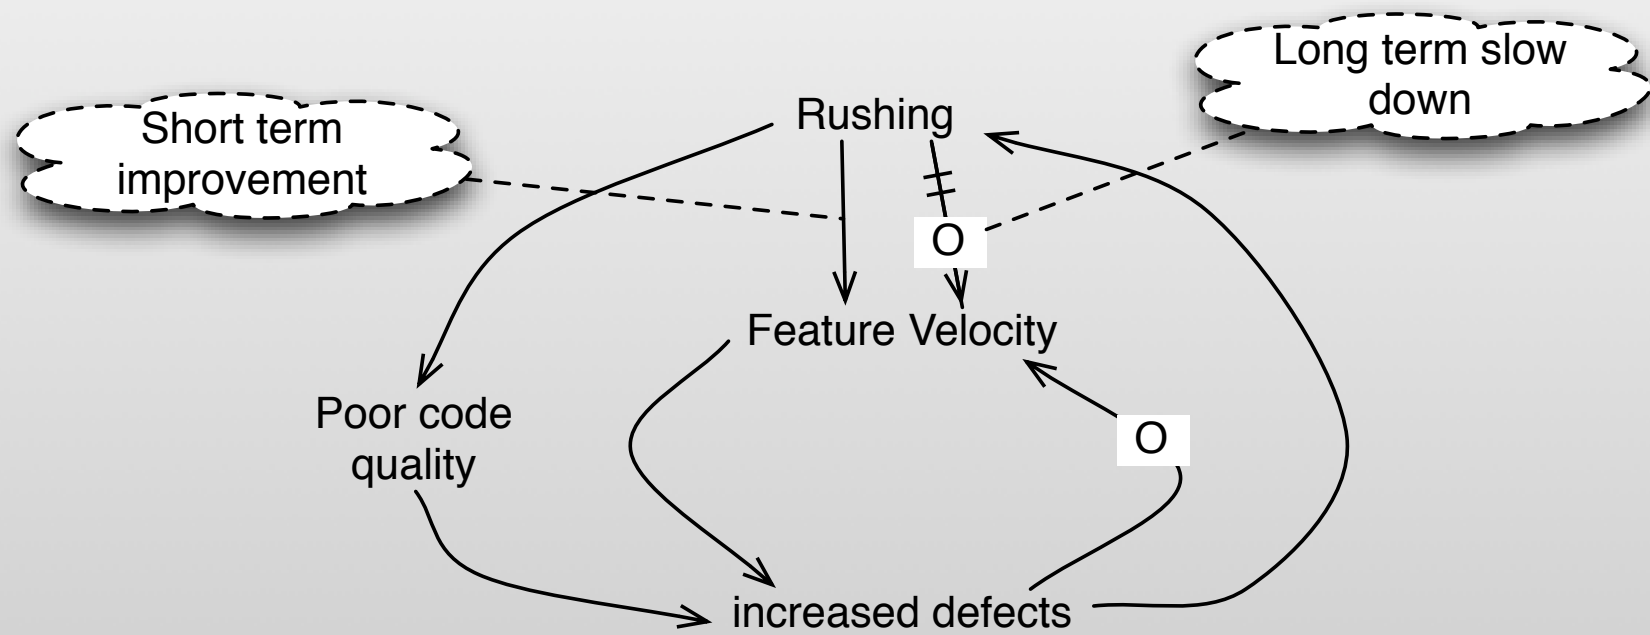

- Testing starts on day one
- Tests provide the specification of what is to be developed
- QA/System Test moves upstream.

Unit Tests are Critical

Higher Level Tests Cannot be Broadly Thorough

1000 (or more) tests are needed to test this simple system

Unit Tests Can Be Thorough

As few as 30 unit tests and 15
integration test when tested as units

Renaissance Software Consulting

Manual Test is Not Sustainable

$$E_t = f(E_d)$$

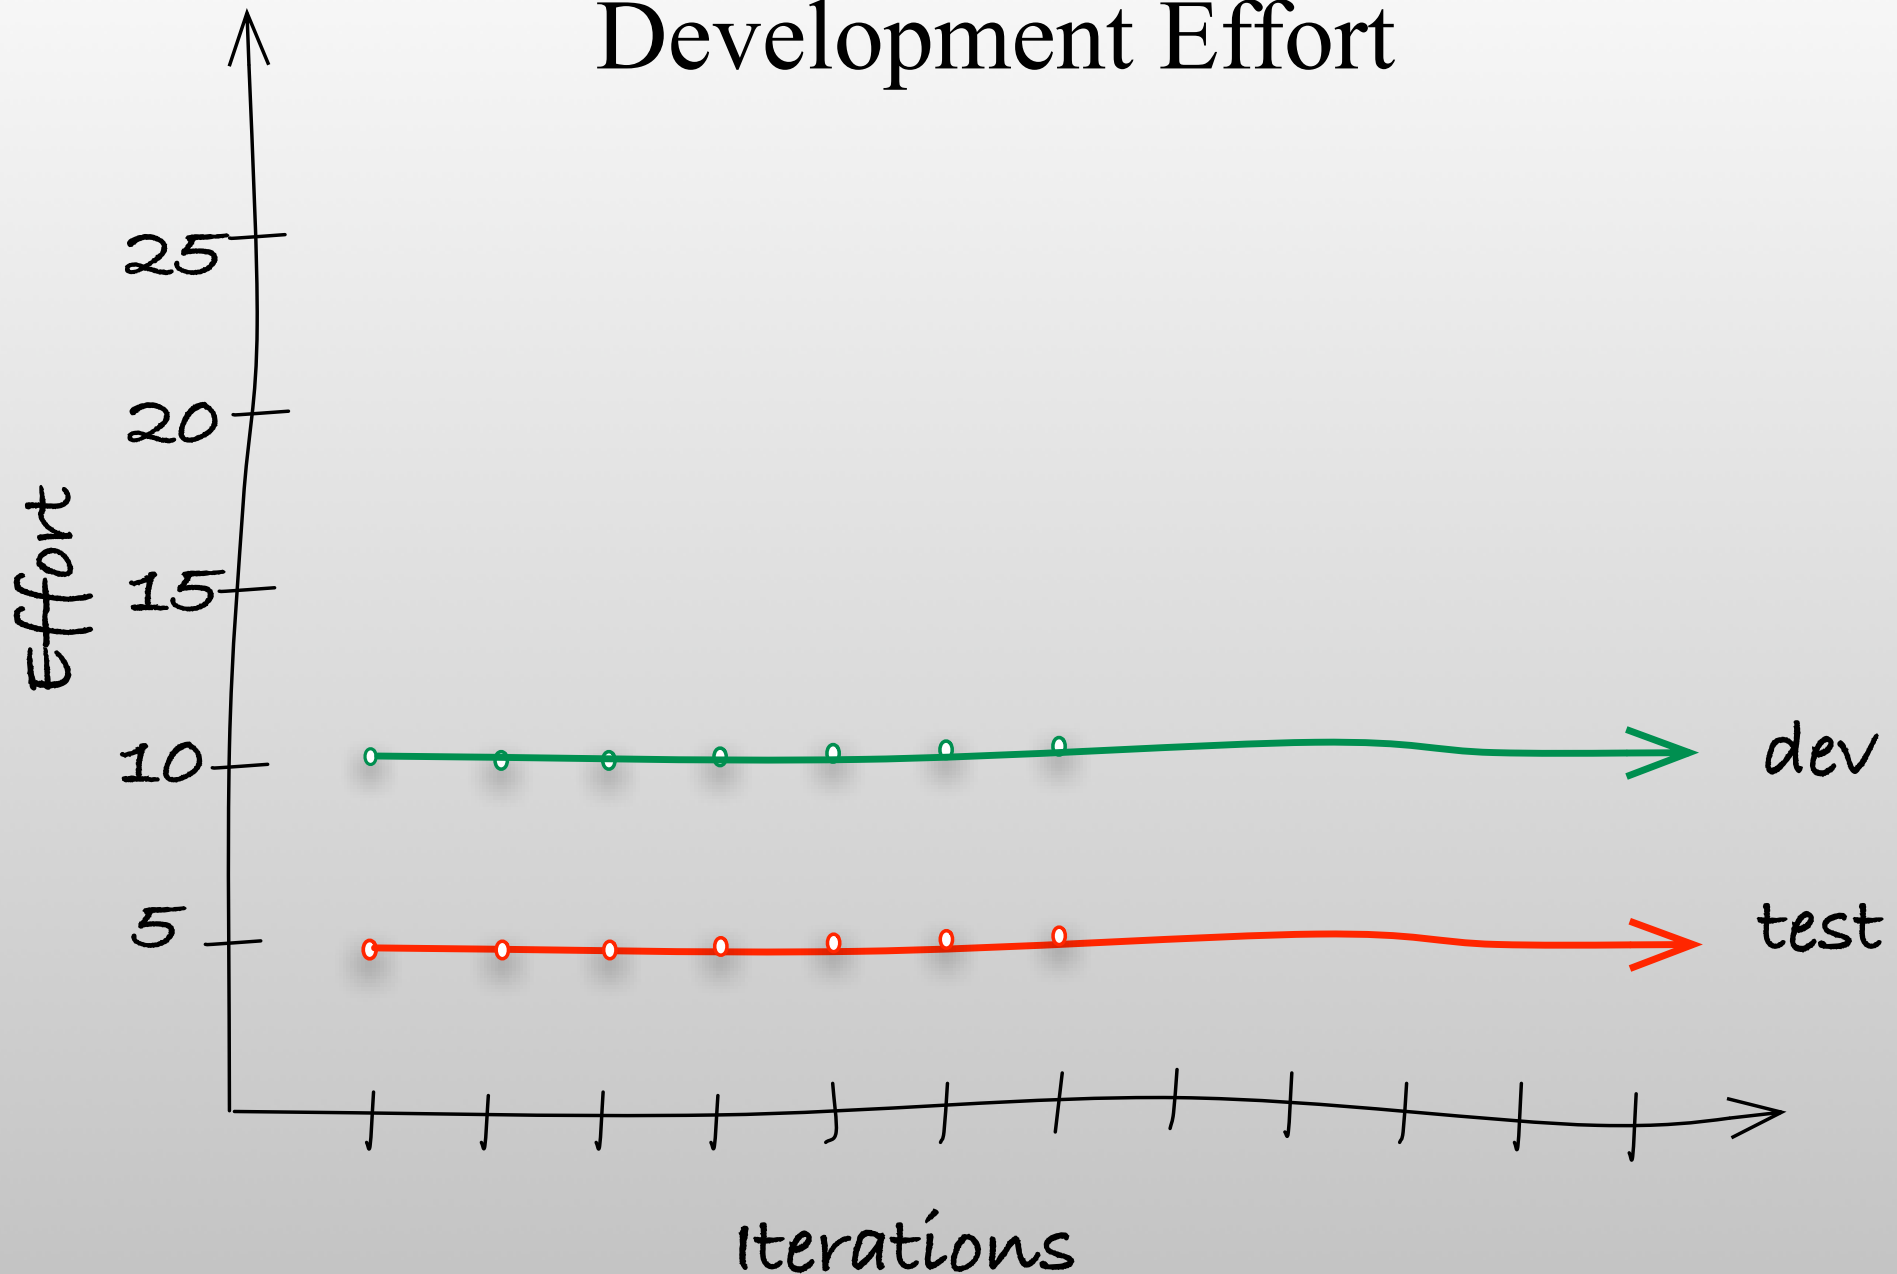

E_t is the effort to test a new feature, and is a function of the effort to develop the feature.

E_d is the effort to develop a new feature

Assume a constant linear relationship

$$E_t = f(E_d) = KE_d$$

Assume Test Effort is Proportional to Development Effort

If a system is working,
leave it alone. Don't
change anything

Systems don't
appreciate being fiddled
and diddled with

- 25% of all defects are introduced while changing and fixing code

[R.B Grady, Software Process Improvement]

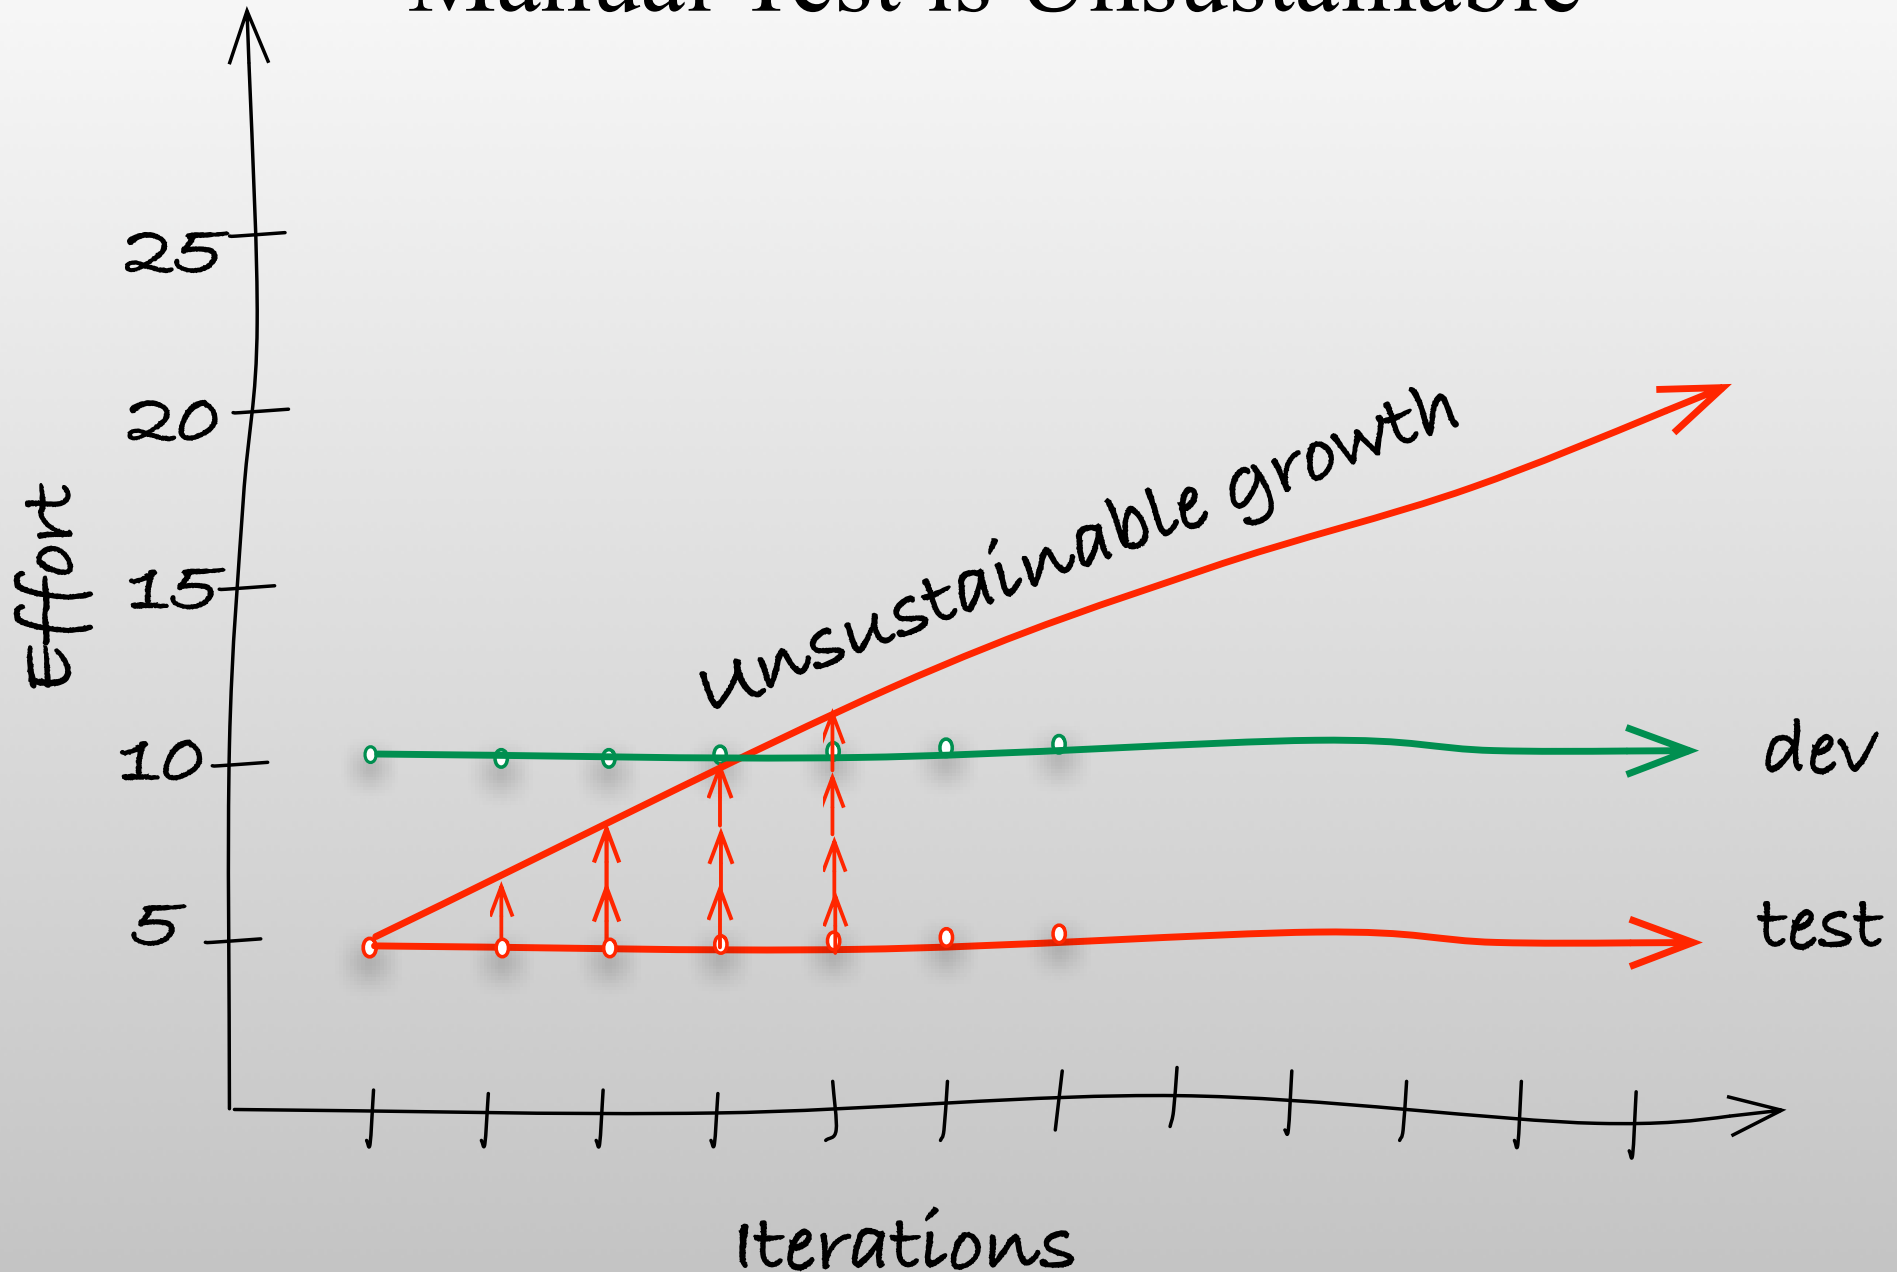

$$E_{tn} = f(E_d) + \sum_{i=0}^n C \times E_t(i)$$

E_{tn} is the effort to fully test a product at iteration N

Because any change can break previously working software, we must retest.

E_{tn} is a function of the effort to develop the feature plus some fraction of the effort to test all previous iterations.

Manual Test is Unsustainable

Risk Accumulates in the Untested Code Gap
